(54) HYDROGEN FUEL SUPPLY SYSTEM

(57) Abstract:

PROBLEM TO BE SOLVED: To prevent drying-up of fossil fuel, increase of carbon dioxide gas, air pollution, and warming of the earth by supplying hydrogen obtained by carrying out electrolysis of water to a hydrogen fuel supplying place, and supplying hydrogen to a hydrogen vehicle.

SOLUTION: Electricity generated by a power generator 2 is supplied to an electrolysis device 3, and water is decomposed into hydrogen and oxygen by electricity. Hydrogen to be decomposed is pressurized by a compressor 4, and is supplied to a storage chamber 5. And then, it is stored in a hydrogen storage alloy 6 in the storage chamber 5. Hydrogen storage alloy 6 in which hydrogen is stored is carried to a hydrogen fuel supplying place 10 provided in the vicinity of the city, and is entered into a discharging chamber 11. Hy-

hydrogen discharged into the discharging chamber 11 is formed as fuel for a hydrogen vehicle 14, and the hydrogen vehicle 14 is traveled by a pump 13. Since fossil fuel is not used in power generation, it is possible to prevent generation of the problem such as drying-up of fossil fuel, increase of carbon dioxide gas, air pollution, and warming of the earth.
